17 Beans, Bountiful

**CULTURE:** Plant in the spring after danger of frost and the soil is warm. For a continuous supply plant every 2 to 3 weeks until late August. Select any well drained soil of loose texture with a pH of 5.5 to 6.5. Fertilize with 800 lbs. of 6-12-6 or 5-10-10 per acre (3 quarts per 100 ft. row). Snap beans are susceptible to fertilizer injury, mix fertilizer well with soil or apply in bands on each side and below seed. Make rows 2½ to 3 feet apart and plant seed 1½ inches deep and 2 to 3 inches apart. Cultivate shallowly. Do not cultivate or pick beans when vines are wet. Sidedress at time of bloom with 15 pounds nitrogen per acre (½ cup of Nitrate of Soda, or equivalent, per 100 ft. of row). Fifty pounds of seed to plant one acre; one lb. per 200 feet of row.

These outstanding characteristics makes Wade an important shipping and marketing variety, as well as a processing bean. Excellent for freezing. A yield test by an N. C. Experiment Station showed 219.9 bu. per acre compared to 197.8 bu. per acre for Tendergreen. ## VEGETABLE ROOTS ASPARAGUS ROOTS and SEEDS

**CULTURE:** Dig or plow out a trench 18 to 24 inches deep, put in plenty of well-rotted manure, covering it with a few inches of soil, then set the roots 1½ to 2 feet apart and cover with 4 inches of soil. In the fall, cut off and burn the top growth, plow or throw down the earth and give a good application of stable manure. Early in the spring fork this in and apply ground bone meal. If white asparagus is wanted draw earth around the stalks as they grow. Do not continue cutting too long as this exhausts the plants. 100 roots plant about 15x50 feet; 5,000 to 7,000 will plant an acre.

Mix thoroughly with the soil 1,500 lbs. of 5-10-10 fertilizer per acre (6 qts. per 100 ft. of row). Transplant to field when plants are 5-6 inches high. Plant in rows 18-30 inches apart with plants 6 to 8 inches apart in the row. Sidedress with 15 lbs. of nitrogen three times at 2 week intervals, beginning 3-4 weeks after transplanting to field. Cultivate regularly to control weeds and grass. Three ounces of seed will produce plants for one acre. One ounce of seed will produce about 20,000 plants.

One pound will plant about 200 hills; 10 pounds will plant an acre

**CULTURE:** Sweet corn, a warm season annual, is increasing rapidly in importance in the South. Improved methods of refrigeration and handling which reduce the rate of loss of sugar, have made it possible to produce sweet corn commercially. It is a standard crop in home gardens. After harvest, sweet corn should be immediately placed in temperature conditions of 35-40 degree F to prevent the loss of sugar and a lowering of quality. It can be grown on a great variety of soils. A well drained sandy loam with adequate humus supply and moisture is desirable. Fertilize with 500 lbs. of 8-8-8 per acre (2 qts. per 100 ft. of row) prior to planting the seed. Sweet corn responds to nitrogen sidedressing. Apply about 80 lbs. of nitrogen in split applications, 40 lbs. (1½ cups of Nitrate of Soda, or equivalent, per 100 ft. of row) when plants are about knee high and 40 lbs. when tassels begin to show. Plant seed in hills one foot apart, or drill seed and thin. One or two plants per foot is recommended. Rows should be spaced 3 feet apart. Two ounces of seed to plant 100 ft. of row; 10 lbs. seed per acre.

# Idaho Grown GARDEN PEAS

Cow-peas or Field Peas

Seed should be drilled 1½ to 2 inches in depth in rows 3½ feet apart. Three-fourths of a pound of seed will plant 100 ft. of row; 100 lbs. of seed to plant one acre.

# TOMATOES

## Plant Successively, Grow a Surplus to Can

**CULTURE:** The tomato is a warm season crop and requires a relatively long season. It is tender and will not withstand a hard freeze. The general practice for a spring crop is to sow the seed in a warm protected bed in late January or early February. The seedlings may be transplanted to a cold frame prior to transplanting to the field, or they may be thinned and transplanted direct from the original bed. In either case, the plants should be hardened sufficiently to stand the field conditions. They should not be set to the field before the danger of freezes is past. The tomato is grown on all types of soil from sands to heavy clays. A sandy loam moderately high in organic matter and nitrogen, with a pH between 5.5 to 6.5 is most desirable. Fertilize with 800 to 1,200 pounds of 5-10-10 per acre (3-5 qts. per 100 ft. of row). After about 3 weeks in the field, apply 30 pounds of nitrogen in 15 lb. applications (½ cup of Nitrate of Soda, or equivalent, per 100 ft. of row) at 2 week intervals. Space plants 2 to 3 feet apart in rows 4 to 5 feet apart. One-fourth pound of seed will produce enough plants for one acre

# Vegetable Planting Calendar

Many otherwise successful gardeners lose months of valuable production because of a failure to realize the cold hardiness of a number of the most popular and productive vegetables.

By successive plantings beet, broccoli, cabbage, carrot, chard, kale, mustard, onion, parsley, radish, spinach and turnip (salad or root) can be kept in production, out-of-doors and without protection winter or summer, every day in the year in this isothermal zone.

The planting information shown in the chart on this page is the result of careful preparation and years of actual gardening experience. Planting dates shown for tender varieties are

based on the average U. S. Weather Bureau records of the last killing frost in the spring and the first killing frost in the fall in this zone, for the past 50 years.

Throughout our catalog we have endeavored to give the approximate number of days to maturity for all varieties. This information should be helpful, especially in determining the latest safe date to plant tender varieties in the summer or fall, in order to make a crop before frost.

Soil conditions permitting, we recommend planting on or immediately after the average date of the last frost in the spring, otherwise spring rains may delay planting days or weeks.

## "TESTED SEEDS"

The term "tested seeds" as used in this catalog, and in all of our advertising means that every bag or package of seeds purchased at Wyatt-Quarles is supplied from a lot that has been carefully tested by the North Carolina Seed Testing Laboratory and the seeds are known to grow. Every lot of seeds reaching our warehouse is sampled and tested before the seeds are moved into our store for packaging or for sale in bulk. This accounts for the fact that "Wyatt-Quarles Tested Seeds" are more and more in demand in North Carolina and in the South.

Plant Wyatt-Quarles Tested Seeds and be sure of success.

### Peat

Remember, your garden can be no better than your soil. Get Premier Peat Moss, with the certified seal.

For new lawns 1 bale should be thoroughly pulverized and mixed in each 100 to 200 sq. ft. of lawn area. Nothing is so beneficial to establish lawns as a bale of peat mixed with 100 pounds of Sheep Manure applied to each 2,000 sq. ft. 3 or 4 times each summer. Peat should also be used liberally in gardens, flower beds and borders and as a mulch for shrubbery, because of its capacity to hold moisture. Seed of the double and fringed sorts should be pressed into a shallow pot of sifted soil and covered with only a sprinkling of sand. The pot should be watered from below by placing it in water. Never allow to become too dry nor too moist.

# CLOVER SEEDS

F97 Alfalfa

F94 Lespedeza, Rowan

## F89 Ladino, Blue Tag Certified

A perennial clover of exceptional merit for pastures, especially on moist, fertile land. Recovers rapidly from grazing or clipping and is leafy and succulent. Its growing season is as long as that of any other legume. Like all clovers, Ladino succeeds best on well limed and fertilized land. Sow 5 to 6 pound per acre alone or 1 to 3 pounds in mixtures. Prices: Calif. Blue Tag Certified lb. \$1.20; 2-9 lbs. \$1.00 lb.; 10-49 lbs. 92c lb., postpaid. Not prepaid, 10-49 lbs. 80c; 50 lbs. or more 75c lb.

## ALFALFAS

**CULTURE:** Alfalfa is a relatively expensive crop, but the first cutting usually returns about double the cost of seeds, lime, fertilizer and planting. A good method is to lime the land and plant an annual legume crop that can be thoroughly disked, not turned, in preparing the alfalfa seed bed. Use 20 to 35 pounds (not more) borax per acre and drill August 20 to October 1, or February 15 to March 25, 25 to 40 pounds of thoroughly inoculated seeds per acre. Roll or cultipack after seeding. At seeding time use 1,200 pounds 2-12-12 and 8-10 tons barnyard manure if available and not weed infested. Apply 400 pounds 0-12-12 annually thereafter. Cut before  $\frac{1}{4}$  flowers open. Always leave the alfalfa stand 6 inches tall or more for winter since any closer cutting invariably results in severe damage. If your stand of alfalfa becomes thin or weak sow 3 to 5 lbs. Orchard grass per acre to help control weeds and increase production.

**F95 Atlantic Alfalfa** N. C. Experiment Station reports up to a fifth more production with Atlantic than with other adapted strains, following good practices. We offer premium quality seeds of the highest purity. Prices: lb. 85c; 2-9 lbs. 73c per lb.; 10-59 lbs. 60c lb., postpaid. Not prepaid, 10-59 lbs. 53c lb.; 60 lbs. or more 48c lb.

**F97 Alfalfa (Oklahoma)** We handle only quality noxious weed free Alfalfa seeds. Prices: lb. 85c; 2-9 lbs. 65c per lb.; 10-59 lbs. 52c per lb., postpaid. Not prepaid, 10-59 lbs. 45c per lb.; 60 lbs. or more 40c lb.

**F98 Alfalfa (Kansas)** Recommended because of its cold resistance. We consider our Oklahoma seeds equal to it in every respect and usually a few cents per pound cheaper. Prices: lb. 85c; 2-9 lbs. 65c lb.; 10-59 lbs. 52c lb., postpaid. Not prepaid, 10-59 lbs. 45c lb.; 60 lbs. or more 40c lb.

## CLOVER

**F83 Crimson Clover** Should be sown from August to October, 25 to 30 pounds per acre; with grain or vetches, 15 pounds. Write for prices.

**F87 White Blossom Sweet Clover** Adapted to most soils: is used for pasture, forage, ensilage, bees, soil improvement and inoculant, and grazing. Especially good as a manure crop and to inoculate the soil in preparation for a crop of alfalfa. The roots break up, aerate and drain stiff subsoils and add humus. Spring sowings will yield a crop the following fall and two crops the following year. Sow 15 pounds per acre July to October or February, March. Prices: lb. 70c; 2 to 9 lbs. @ 50c per lb.; 10 to 59 lbs. @ 37c lb., postpaid. Not prepaid, 10 to 59 lbs. @ 30c lb.; 60 lbs. or more @ 27c lb.

**F80 White Dutch Clover** Because of its spreading habit and persistent year 'round growth White Dutch is invaluable for lawn and pasture use. It grows in all soils and will grow both in the shade and open areas responding to lime and fertilizers recommended for other clovers. Like other clovers White Dutch enriches the soil while furnishing nutritious grazing. Sow 6 to 8 pounds per acre alone or 2 to 3 pounds with other clovers or grasses. Prices: lb. \$1.35; 2-9 lbs. \$1.15; 10-59 lbs. \$1.02 lb., postpaid. Not prepaid, 10-59 lbs. 95c lb.; 60 lbs. or more 90c lb.

**F82 Red Clover** One of the most productive of the clovers Well adapted to our Piedmont soils. Especially valuable in pasture mixtures, soil building and hay making. Sow early spring or fall 20 pounds per acre. Lime and fertilize as for other clovers. Prices: lb. 95c; 2-9 lbs. 77c lb.; 10-59 lbs. 64c lb., postpaid. ## LESPEDEZAS

**F95 Sericea Lespedeza (Perennial)** Scarified and recleaned. It grows on the poorest soils without fertilizer or lime and while it steadily improves the land, it produces an abundance of nutritious hay if cut when tender. Prices: lb. 70c; 2-9 lbs. 49c; 10-59 lbs. 36c lb., postpaid. Not prepaid, 10-59 lbs. 29c lb.; 60-99 lbs. 26c lb.; 100 lbs. or more 24c lb.

**F94 Rowan Lespedeza** A new high yielding variety of Korean Lespedeza, resistant to powdery mildew and two common forms of rootknot nematode. In N. C. its superior yielding ability has been particularly striking on nematode infested soils, where in trials, it has doubled the yield of Korean. On nematode free soils, differences have not been as great, but it is considered superior to common Korean where nematodes are not a problem. Rowan is not resistant to all forms of nematode. It is adapted throughout the Korean belt and matures about the same time as Korean. In the tidewater area, Kobe is still recommended. Prices: lb. 65c; 2-9 lbs. 47c lb.; 10-24 lbs. 34c lb., postpaid. Not prepaid, 25-99 lbs. 24c lb.; 100 lbs. or more 22c lb.

**F93 Kobe Lespedeza** A variety particularly adapted to lowlands and lighter soils. The leaves and stems are slightly coarser, making a heavier hay crop. Recommended by Experiment Stations for all but the mountainous regions of North Carolina, South Carolina and Virginia. Sow 30 to 40 lbs. per acre. Responds to liming and fertilizing. Write for prices.

**F92 Korean Lespedeza** Does best in heavy soils. Unexcelled for hay crop since it will produce from 2 to 4 tons of good hay per acre on a good thick even stand. It is almost equal to alfalfa in feeding value, and compares favorably in fineness, palatability and protein content. Korean is earlier than other lespedezas, enabling harvest in time for planting small grain. Sow 30 pounds of seed per acre February to April. Write for prices.

**F1 Dixie 82 (Yellow)** In 14 experiment station tests during 1949-1951 this 2-ear yellow hybrid produced an average yield of 78.2 bushels per acre. Repeated tests indicate Dixie 82 out-yields N. C. 27 except under severe drought conditions. Grain quality is good with some variation in the color, good root and stalk strength. It is more susceptible to weevil than N. C. 27, moderately susceptible to leaf spot but more resistant to brown spot than N. C. 27. Recommended for both lower and upper Coastal Plain. Prices: 7 lbs. (½ pk.) \$2.15; 14 lbs. Not postpaid, 7 lbs. \$1.55; 14 lbs. \$2.95; 56 lbs. (bu.) \$9.50.

**F27 N. C. 27 (Yellow)** The most widely planted yellow corn in North Carolina and widely adapted and popular in South Carolina, Georgia, Alabama and Tennessee. While it is not the highest yielding yellow corn in every test, other qualities have won for it by far the greatest planter acceptance. Grain quality, shuck coverage, insect resistance and general good appearance and performance are some of these qualities. Root and stalk strength are good and the plants average 179 ears per 100 stalks. Medium maturity. N. C. 27 at its very best, treated, tested and graded is sealed in the Wyatt-Quarles bags. Buy it with confidence at your regular seed suppliers store or order it direct from us. Prices: 7 lbs. (½ pk.) \$2.15; 14 lbs. (pk.) \$3.85, postpaid. **F40 Kentucky Blue Grass** On soils that are suited to Blue Grass it is one of the most important grasses because of its great nutritive value. It succeeds best on sweet soil, but does well on any stiff rich soil. Sow either in the fall or spring. 10 to 15 pounds to the acre. Prices: lb. \$1.40; 2-9 lbs. \$1.20 lb.; 10-24 lbs. \$1.05 lb., postpaid. Not prepaid, 10-24 lbs. \$1.00 lb.; 25-99 lbs. 97c lb.; 100 lbs. or more 95c lb.

**F66 Permanent Lowland Hay and Pasture Mixture**

This Mixture includes the most valuable varieties of grasses and clovers for bottom lands and on good soils produces a maximum of grazing or hay. Red Top, Ky. 31 Fescue, Ladino, Carpet, Dallis, Lespedezas, and other grasses and clovers combine to extend the period of production around the calendar. Sow spring or fall 30 lbs. per acre. Prices: lb. 90c; 2-9 lbs. 70c lb.; 10-24 lbs. 57c lb., postpaid. Not prepaid, 10-24 lbs. 50c lb.; 25-99 lbs. 45c lb.; 100 lbs. or more 40c lb.

**F44 Kentucky 31 Fescue-Certified** A tall or giant Fescue adapted to a wide variety of soils and uses. Like most long lived grasses, growth is slow after germination and should not be grazed until 6 inches high. Once established it promises to be the most versatile and valuable grass in a generation. It is the highest yielding grass in virtually every experiment station where it has been tried; is palatable and grows over a longer period each year than other grasses. This giant has a remarkable resistance to drought and its dense, deep roots make it ideal for erosion control, soil building, weed control, roadside planting, athletic fields, parks, airports, etc. In combination with suitable legumes it produces an excellent almost year 'round pasture. Because it has no underground root stocks it cannot become a pest and is readily killed by plowing. Continued high yields will require feeding, especially nitrogen which may be supplied partly by seeding with clover. Seed in a prepared, firm seed bed fall or early spring 15 to 20 lbs. per acre alone; 8 to 12 lbs. with 3 lbs. Ladino, White Clover, or 15 lbs. Lespedeza. Prices: lb. 75c; 2-9 lbs. 65c lb.; 10-24 lbs. 42c lb., postpaid. Not prepaid, 10-24 lbs. 35c lb.; 25-49 lbs. 32c lb.; 50 lbs. or more 30c lb.

## HEGARI

**F197 Hegari** Recognized as the most valuable and widely adapted member of the sorghum family, and well suited to conditions in the Southern states. Hegari has great forage value for two reasons. First because its high sugar content makes stalks and leaves highly palatable to livestock, and second, it yields heavily with its many broad leaves and substantial stalks. As an ensilage crop many acres are planted to Hegari every year in the South. As a pasture crop, in thickly seeded plantings it pastures well and also makes good hay. Its largest use is in bundle feeding and it can be left shocked in the field until fed, or as is coming into more general practice, it is ground head, stalks and leaves through a hammer mill. Hegari makes a good substitute crop for corn, which it out yields on light soils, and it can be planted much later. Prices: lb. 55c; 2 to 9 lbs. @ 35c; 10 to 24 lbs. @ 22c lb., postpaid. Not prepaid, 10 to 24 lbs. @ 15c; 25 to 99 lbs. @ 12c; 100 lbs. or more @ 10c lb.

## Pre-Tested INOCULANTS

More and more growers have become convinced that the use of a good inoculator . . . on legume seed just before every planting . . . pays big returns.

Before being released for use, every lot of NOD-O-GEN is pre-tested in Laboratory and greenhouse to make sure of the presence of billions of vigorous bacteria of the right kind. Be sure to name seeds to be inoculated when ordering.

Inoculation of Legume Crops improves their quality, insures a better and more luxuriant growth and a bigger yield. Well inoculated legumes also enrich the soil, as inoculation with Legume nodule bacteria enables the legume plant to utilize nitrogen from the air.

## SOYBEANS

**F143 Roanoke** A new bean developed in the N. C. Experiment Station, U.S.D.A. Co-operating. Bean yield is higher than other popular varieties and the oil content of the bean is higher. Write for Prices.

**F144 Jackson** A new soybean developed by the U.S.D.A. and co-operating State Experiment Stations. Adapted in the Coastal Plain and Gulf Coast areas of the Southeast, Jackson is expected to lower soybean production costs through higher yields, resistance to lodging, seed quality, oil content and other desirable characteristics. Plants average 39.6 inches high compared with Roanoke 36.5, yield is ½ to 2½ bushels per acre better than Roanoke, a day or two later, and oil content 21.7 compared with 22 per cent for Roanoke. A most important characteristic is Jackson's ability to make taller growth on lighter soils and produce higher yields of beans than comparable varieties. Write for Prices.

F145 Soybean, Lee

**F145 Lee** A new variety developed by the U.S.D.A. and co-operating State Experiment Stations in the Southeast. It is the most shatter resistant variety so far developed and is resistant to several major soybean diseases. Lee has shown little shattering 8 to 10 weeks after maturity and is expected to replace Ogden for this reason. Lee is also more tolerant to rootknot nematode than Ogden.

This variety is especially adapted to the eastern two-thirds of North Carolina and a large area of the Southeast and Mid-South. Yields averaged 29.3 bushels per acre in over 90 tests in 12 Southeastern states during 1951-53. Oil content averaged 21.5 for Lee and 21.3 for Ogden. Plants average 30 to 36 inches high, have moderate sized stems, heavy foliage and purple flowers. Write for Prices.

**F146 Ogden** Ogden is considerably earlier than most beans and is consequently better adapted to rotations with small grains. Seedings as late as June in the Wake County trials made a substantial production of hay. Average bean yield from 6 tests at scattered points in the state during 1943 was 27.8 bushels per acre. Plants are nicely branched and, for that reason are more desirable for hay than the coarser growing types. Write for Prices.

Soybeans are better when the seeds are inoculated

Field tests show 27 per cent increase in yield when seeds are treated with Arasan. Average of 22 tests conducted in North Carolina showed \$16.43 per acre increase return where peanuts were dusted 4 times with sulphur-copper dust, after deducting the cost of dusting.

**F226 NC-2** This is one of the new peanuts developed by the N. C. Experiment Station. The superior vigor and uniformity of NC-2 resulting in higher yields and a greater percentage of extra large kernels of higher market value make it a more profitable variety. Compared with good farm stock seeds in 14 tests during 1952 in the 8 largest N. C. peanut counties, NC-2 produced 2657 to 2411 pounds per acre; 68% against 64% marketable; 37% extra large kernels to 28% in the farm stock and brought a total average of \$12.87 per 100 lbs. compared with \$12.01, for a per acre average earning of \$341.96 for NC-2 compared with \$289.56 with farm run. A similar superiority prevailed in 6 tests during the dry 1954 season.
